NAME

```
gbz80 — CPU opcode reference
```

DESCRIPTION

This is the list of opcodes supported by rgbasm(1), including a short description, the number of bytes needed to encode them and the number of CPU cycles at 1MHz (or 2MHz in GBC dual speed mode) needed to complete them.

Note: All arithmetic/logic operations that use register A as destination can omit the destination as it is assumed to be register A by default. The following two lines have the same effect:

```
OR A,B
OR B
```

LEGEND

List of abbreviations used in this document.

```
Any of the 8-bit registers (A, B, C, D, E, H, L).
```

- Any of the general-purpose 16-bit registers (BC, DE, HL).
- *n8* 8-bit integer constant.
- *n*16 16-bit integer constant.
- *e8* 8-bit offset (**-128** to **127**).
- u3 3-bit unsigned integer constant (0 to 7).
- cc Condition codes:

Z Execute if Z is set.NZ Execute if Z is not set.C Execute if C is set.

NC Execute if C is not set. ! cc Negates a condition code.

vec One of the **RST** vectors (0x00, 0x08, 0x10, 0x18, 0x20, 0x28, 0x30, and 0x38).

INSTRUCTION REFERENCE

ADC A,r8

Add the value in r8 plus the carry flag to **A**.

Cycles: 1
Bytes: 1
Flags:

Z Set if result is 0.

N (

H Set if overflow from bit 3.C Set if overflow from bit 7.

ADC A,[HL]

Add the byte pointed to by **HL** plus the carry flag to **A**.

Cycles: 2 Bytes: 1

Flags: See ADC A,r8

ADC A,n8

Add the value n8 plus the carry flag to A.

Cycles: 2 Bytes: 2

Flags: See ADC A,r8

ADD A,r8

Add the value in r8 to **A**.

Cycles: 1
Bytes: 1
Flags:

Z Set if result is 0.

N (

H Set if overflow from bit 3.C Set if overflow from bit 7.

ADD A,[HL]

Add the byte pointed to by HL to A.

```
Cycles: 2
    Bytes: 1
    Flags: See ADD A,r8
ADD A,n8
    Add the value n8 to A.
    Cycles: 2
    Bytes: 2
    Flags: See ADD A,r8
ADD HL,r16
    Add the value in r16 to HL.
    Cycles: 2
    Bytes: 1
    Flags:
    \mathbf{N}
             Set if overflow from bit 11.
    H
    \mathbf{C}
             Set if overflow from bit 15.
ADD HL,SP
    Add the value in SP to HL.
    Cycles: 2
    Bytes: 1
    Flags: See ADD HL,r16
ADD SP,e8
    Add the signed value e8 to SP.
    Cycles: 4
    Bytes: 2
    Flags:
    \mathbf{Z}
             0
    \mathbf{N}
    H
             Set if overflow from bit 3.
    \mathbf{C}
             Set if overflow from bit 7.
AND A,r8
    Bitwise AND between the value in r8 and A.
    Cycles: 1
    Bytes: 1
```

Flags:

 \mathbf{Z}

Set if result is 0.

```
N 0
H 1
C 0
```

AND A,[HL]

Bitwise AND between the byte pointed to by **HL** and **A**.

Cycles: 2 Bytes: 1

Flags: See AND A,r8

AND A,n8

Bitwise AND between the value in n8 and A.

Cycles: 2 Bytes: 2

Flags: See AND A,r8

BIT u3,r8

Test bit u3 in register r8, set the zero flag if bit not set.

Cycles: 2
Bytes: 2
Flags:

Z Set if the selected bit is 0.

N 0 **H** 1

BIT u3,[HL]

Test bit u3 in the byte pointed by **HL**, set the zero flag if bit not set.

Cycles: 3 Bytes: 2

Flags: See BIT u3,r8

CALL n16

Call address n16. This pushes the address of the instruction after the CALL on the stack, such that **RET** can pop it later; then, it executes an implicit **JP n16**.

Cycles: 6
Bytes: 3

Flags: None affected.

CALL cc,n16

Call address n16 if condition cc is met.

Cycles: 6 taken / 3 untaken

Bytes: 3

```
Flags: None affected.
```

CCF

```
Complement Carry Flag.
```

Cycles: 1

Bytes: 1

Flags:

 \mathbf{N} 0

 $\mathbf{H} = 0$

C Inverted.

CP A,r8

Subtract the value in r8 from **A** and set flags accordingly, but don't store the result. This is useful for Com-Paring values.

Cycles: 1

Bytes: 1

Flags:

Z Set if result is 0.

 \mathbf{N}

H Set if borrow from bit 4.

C Set if borrow (i.e. if r8 > A).

CP A,[HL]

Subtract the byte pointed to by **HL** from **A** and set flags accordingly, but don't store the result.

Cycles: 2

Bytes: 1

Flags: See CP A,r8

CP A,n8

Subtract the value n8 from A and set flags accordingly, but don't store the result.

Cycles: 2

Bytes: 2

Flags: See CP A,r8

CPL

ComPLement accumulator $(A = \tilde{A})$.

Cycles: 1

Bytes: 1

Flags:

N 1

H 1

```
DAA
```

Decimal Adjust Accumulator to get a correct BCD representation after an arithmetic instruction.

Cycles: 1 Bytes: 1

Flags:

Z Set if result is 0.

 \mathbf{H}

C Set or reset depending on the operation.

DEC r8

Decrement value in register r8 by 1.

Cycles: 1
Bytes: 1
Flags:

Z Set if result is 0.

N 1

H Set if borrow from bit 4.

DEC [HL]

Decrement the byte pointed to by **HL** by 1.

Cycles: 3 Bytes: 1

Flags: See DEC r8

DEC r16

Decrement value in register r16 by 1.

Cycles: 2 Bytes: 1

Flags: None affected.

DEC SP

Decrement value in register **SP** by 1.

Cycles: 2 Bytes: 1

Flags: None affected.

DI

Disable Interrupts by clearing the IME flag.

Cycles: 1 Bytes: 1

Flags: None affected.

\mathbf{EI}

Enable Interrupts by setting the IME flag. The flag is only set after the instruction following EI.

Cycles: 1 Bytes: 1

Flags: None affected.

HALT

Enter CPU low-power consumption mode until an interrupt occurs. The exact behavior of this instruction depends on the state of the **IME** flag.

IME set The CPU enters low-power mode until *after* an interrupt is about to be serviced. The handler is executed normally, and the CPU resumes execution after the **HALT** when that returns.

IME not set

The behavior depends on whether an interrupt is pending (i.e. [IE] & [IF] is non-zero).

None pending

As soon as an interrupt becomes pending, the CPU resumes execution. This is like the above, except that the handler is *not* called.

Some pending

The CPU continues execution after the **HALT**, but the byte after it is read twice in a row (**PC** is not incremented, due to a hardware bug).

Cycles: Bytes: 1

Flags: None affected.

INC r8

Increment value in register r8 by 1.

Cycles: 1
Bytes: 1
Flags:

Z Set if result is 0.

N (

H Set if overflow from bit 3.

INC [HL]

Increment the byte pointed to by HL by 1.

Cycles: 3 Bytes: 1

Flags: See INC r8

INC r16

Increment value in register r16 by 1.

Cycles: 2

```
Bytes: 1
```

INC SP

Increment value in register **SP** by 1.

Cycles: 2

Bytes: 1

Flags: None affected.

JP n16

Jump to address n16; effectively, store n16 into **PC**.

Cycles: 4
Bytes: 3

Flags: None affected.

JP cc,n16

Jump to address n16 if condition cc is met.

Cycles: 4 taken / 3 untaken

Bytes: 3

Flags: None affected.

JP HL

Jump to address in **HL**; effectively, load **PC** with value in register **HL**.

Cycles: 1

Bytes: 1

Flags: None affected.

JR e8

Relative Jump by adding e8 to the address of the instruction following the **JR**. To clarify, an operand of 0 is equivalent to no jumping.

Cycles: 3

Bytes: 2

Flags: None affected.

JR cc,e8

Relative Jump by adding e8 to the current address if condition cc is met.

Cycles: 3 taken / 2 untaken

Bytes: 2

Flags: None affected.

LD r8,r8

Load (copy) value in register on the right into register on the left.

Cycles: 1 Bytes: 1

Flags: None affected.

LD r8.n8

Load value n8 into register r8.

Cycles: 2 Bytes: 2

Flags: None affected.

LD r16.n16

Load value n16 into register r16.

Cycles: 3
Bytes: 3

Flags: None affected.

LD [HL],r8

Store value in register r8 into the byte pointed to by register **HL**.

Cycles: 2 Bytes: 1

Flags: None affected.

LD [HL],n8

Store value n8 into the byte pointed to by register HL.

Cycles: 3 Bytes: 2

Flags: None affected.

LD r8,[HL]

Load value into register r8 from the byte pointed to by register **HL**.

Cycles: 2 Bytes: 1

Flags: None affected.

LD [r16],A

Store value in register A into the byte pointed to by register r16.

Cycles: 2 Bytes: 1

LD [n16],A

Store value in register A into the byte at address n16.

Cycles: 4

Bytes: 3

Flags: None affected.

LDH [n16],A

Store value in register A into the byte at address n16, provided the address is between \$FF00 and \$FFFF.

Cycles: 3

Bytes: 2

Flags: None affected.

This is sometimes written as LDIO [n16], A, or LD [\$FF00+n8], A.

LDH [C],A

Store value in register **A** into the byte at address FF00+C.

Cycles: 2

Bytes: 1

Flags: None affected.

This is sometimes written as LDIO [C], A, or LD [\$FF00+C], A.

LD A,[r16]

Load value in register A from the byte pointed to by register r16.

Cycles: 2

Bytes: 1

Flags: None affected.

LD A,[n16]

Load value in register A from the byte at address n16.

Cycles: 4

Bytes: 3

Flags: None affected.

LDH A,[n16]

Load value in register A from the byte at address n16, provided the address is between \$FF00 and \$FFFF.

Cycles: 3

Bytes: 2

Flags: None affected.

This is sometimes written as LDIO A, [n16], or LD A, [\$FF00+n8].

LDH A,[C]

Load value in register **A** from the byte at address FF00+c.

Cycles: 2
Bytes: 1

Flags: None affected.

This is sometimes written as LDIO A, [C], or LD A, [\$FF00+C].

LD [HLI],A

Store value in register $\bf A$ into the byte pointed by $\bf HL$ and increment $\bf HL$ afterwards.

Cycles: 2

Bytes: 1

Flags: None affected.

This is sometimes written as LD [HL+], A, or LDI [HL], A.

LD [HLD],A

Store value in register **A** into the byte pointed by **HL** and decrement **HL** afterwards.

Cycles: 2

Bytes: 1

Flags: None affected.

This is sometimes written as LD [HL-], A, or LDD [HL], A.

LD A,[HLD]

Load value into register A from the byte pointed by HL and decrement HL afterwards.

Cycles: 2

Bytes: 1

Flags: None affected.

This is sometimes written as LD A, [HL-], or LDD A, [HL].

LD A,[HLI]

Load value into register A from the byte pointed by HL and increment HL afterwards.

Cycles: 2

Bytes: 1

Flags: None affected.

This is sometimes written as LD A, [HL+], or LDI A, [HL].

LD SP,n16

Load value n16 into register SP.

Cycles: 3 Bytes: 3

```
Flags: None affected.
```

LD [n16],SP

Store **SP & \$FF** at address n16 and **SP** >> **8** at address n16 + 1.

Cycles: 5

Bytes: 3

Flags: None affected.

LD HL,SP+e8

Add the signed value e8 to SP and store the result in HL.

Cycles: 3

Bytes: 2

Flags:

Z 0 **N** 0

H Set if overflow from bit 3.

C Set if overflow from bit 7.

LD SP,HL

Load register HL into register SP.

Cycles: 2

Bytes: 1

Flags: None affected.

NOP

No OPeration.

Cycles: 1

Bytes: 1

Flags: None affected.

OR A,r8

Store into A the bitwise OR of the value in r8 and A.

Cycles: 1

Bytes: 1

Flags:

Z Set if result is 0.

N 0 H 0 C 0

OR A,[HL]

Store into **A** the bitwise OR of the byte pointed to by **HL** and **A**.

```
Cycles: 2

Bytes: 1

Flags: See OR A,r8

OR A,n8

Store into A the bitwise OR of n8 and A.
```

Cycles: 2

Bytes: 2

Flags: See OR A,r8

POP AF

Pop register AF from the stack. This is roughly equivalent to the following *imaginary* instructions:

```
ld f, [sp] ; See below for individual flags
inc sp
ld a, [sp]
inc sp
```

Cycles: 3

Bytes: 1

Flags:

Z Set from bit 7 of the popped low byte.

N Set from bit 6 of the popped low byte.

H Set from bit 5 of the popped low byte.

C Set from bit 4 of the popped low byte.

POP r16

Pop register r16 from the stack. This is roughly equivalent to the following *imaginary* instructions:

```
ld LOW(r16), [sp] ; C, E or L
inc sp
ld HIGH(r16), [sp] ; B, D or H
inc sp
```

Cycles: 3

Bytes: 1

Flags: None affected.

PUSH AF

Push register **AF** into the stack. This is roughly equivalent to the following *imaginary* instructions:

```
dec sp
  ld [sp], a
  dec sp
  ld [sp], flag_Z << 7 | flag_N << 6 | flag_H << 5 | flag_C << 4
Cycles: 4
Bytes: 1</pre>
```

PUSH r16

Push register r16 into the stack. This is roughly equivalent to the following *imaginary* instructions:

```
dec sp
ld [sp], HIGH(r16); B, D or H
dec sp
ld [sp], LOW(r16); C, E or L

Cycles: 4

Bytes: 1

Flags: None affected.
```

RES u3,r8

Set bit u3 in register r8 to 0. Bit 0 is the rightmost one, bit 7 the leftmost one.

Cycles: 2 Bytes: 2

Flags: None affected.

RES u3,[HL]

Set bit u3 in the byte pointed by **HL** to 0. Bit 0 is the rightmost one, bit 7 the leftmost one.

Cycles: 4 Bytes: 2

Flags: None affected.

RET

Return from subroutine. This is basically a **POP PC** (if such an instruction existed). See**POP r16** for an explanation of how **POP** works.

Cycles: 4
Bytes: 1
Flags: None affected.

RET cc

Return from subroutine if condition cc is met.

Cycles: 5 taken / 2 untaken Bytes: 1

Flags: None affected.

RETI

Return from subroutine and enable interrupts. This is basically equivalent to executing **EI** then **RET**, meaning that **IME** is set right after this instruction.

Cycles: 4

```
Bytes: 1
```

RL r8

Rotate bits in register r8 left through carry.

Cycles: 2

Bytes: 2

Flags:

Z Set if result is 0.

N 0 **H** 0

C Set according to result.

RL [HL]

Rotate the byte pointed to by **HL** left through carry.

Cycles: 4

Bytes: 2

Flags: See RL r8

RLA

Rotate register A left through carry.

Cycles: 1

Bytes: 1

Flags:

 \mathbf{Z} 0

 $\mathbf{N} = 0$

H

C Set according to result.

RLC r8

Rotate register r8 left.

Cycles: 2

Bytes: 2

Flags:

Z Set if result is 0.

N 0 **H** 0

C Set according to result.

RLC [HL]

Rotate the byte pointed to by HL left.

Cycles: 4

Bytes: 2

Flags: See RLC r8

RLCA

Rotate register A left.

Cycles: 1

Bytes: 1

Flags:

 \mathbf{Z} 0

 \mathbf{N} 0

H

C Set according to result.

RR r8

Rotate register r8 right through carry.

$$C \rightarrow [7 \rightarrow 0] \rightarrow C$$

Cycles: 2

Bytes: 2

Flags:

Z Set if result is 0.

0

 $\mathbf{N} = 0$

H

C Set according to result.

RR [HL]

Rotate the byte pointed to by **HL** right through carry.

$$C \rightarrow [7 \rightarrow 0] \rightarrow C$$

Cycles: 4

Bytes: 2

Flags: See RR r8

RRA

Rotate register A right through carry.

$$C \rightarrow [7 \rightarrow 0] \rightarrow C$$

RRC r8

 \mathbf{C}

Rotate register r8 right.

$$[0] \rightarrow [7 \rightarrow 0] \rightarrow C$$

Set according to result.

Cycles: 2 Bytes: 2

Flags:

Z Set if result is 0.

N 0 **H** 0

C Set according to result.

RRC [HL]

Rotate the byte pointed to by **HL** right.

$$[0] \rightarrow [7 \rightarrow 0] \rightarrow C$$

Cycles: 4 Bytes: 2

Flags: See RRC r8

RRCA

Rotate register A right.

$$[0] \rightarrow [7 \rightarrow 0] \rightarrow C$$

Cycles: 1

Bytes: 1

Flags:

Z 0 **N** 0 **H** 0

C Set according to result.

RST vec

Call address vec. This is a shorter and faster equivalent to CALL for suitable values of vec.

Cycles: 4

Bytes: 1

Flags: None affected.

```
SBC A,r8
```

```
Subtract the value in r8 and the carry flag from A.
```

Cycles: 1

Bytes: 1

Flags:

Z Set if result is 0.

N

H Set if borrow from bit 4.

C Set if borrow (i.e. if (r8 + carry) > A).

SBC A,[HL]

Subtract the byte pointed to by **HL** and the carry flag from **A**.

Cycles: 2

Bytes: 1

Flags: See SBC A,r8

SBC A,n8

Subtract the value n8 and the carry flag from A.

Cycles: 2

Bytes: 2

Flags: See SBC A,r8

SCF

Set Carry Flag.

Cycles: 1

Bytes: 1

Flags:

N 0 **H** 0

C 1

SET u3,r8

Set bit u3 in register r8 to 1. Bit 0 is the rightmost one, bit 7 the leftmost one.

Cycles: 2

Bytes: 2

Flags: None affected.

SET u3,[HL]

Set bit u3 in the byte pointed by **HL** to 1. Bit 0 is the rightmost one, bit 7 the leftmost one.

Cycles: 4

Bytes: 2

SLA r8

Shift Left Arithmetically register r8.

$$C \leftarrow [7 \leftarrow 0] \leftarrow 0$$

Cycles: 2

Bytes: 2

Flags:

 \mathbf{Z} Set if result is 0.

N Н 0

 \mathbf{C} Set according to result.

SLA [HL]

Shift Left Arithmetically the byte pointed to by HL.

Cycles: 4

Bytes: 2

Flags: See SLA r8

SRA r8

Shift Right Arithmetically register *r8*.

$$[7] \rightarrow [7 \rightarrow 0] \rightarrow C$$

Cycles: 2

Bytes: 2

Flags:

 \mathbf{Z} Set if result is 0.

N Н 0

Set according to result. \mathbf{C}

SRA [HL]

Shift Right Arithmetically the byte pointed to by HL.

$$[7] -> [7 -> 0] -> C$$

Cycles: 4

Bytes: 2

Flags: See SRA r8

SRL r8

Shift Right Logically register r8.

$$0 \rightarrow [7 \rightarrow 0] \rightarrow C$$

```
Cycles: 2

Bytes: 2

Flags:

Z Set if result is 0.

N 0

H 0

C Set according to result.
```

SRL [HL]

Shift Right Logically the byte pointed to by HL.

$$0 \rightarrow [7 \rightarrow 0] \rightarrow C$$

Cycles: 4 Bytes: 2

Flags: See SRA r8

STOP

Enter CPU very low power mode. Also used to switch between double and normal speed CPU modes in GBC.

Cycles: -

Bytes: 2

Flags: None affected.

SUB A,r8

Subtract the value in r8 from **A**.

Cycles: 1

Bytes: 1

Flags:

Z Set if result is 0.

N

H Set if borrow from bit 4. **C** Set if borrow (set if r8 > A).

SUB A,[HL]

Subtract the byte pointed to by HL from A.

Cycles: 2 Bytes: 1

Flags: See SUB A,r8

SUB A,n8

Subtract the value n8 from A.

Cycles: 2 Bytes: 2

```
Flags: See SUB A,r8
```

SWAP r8

Swap the upper 4 bits in register r8 and the lower 4 ones.

Cycles: 2 Bytes: 2

Flags:

Z Set if result is 0.

N 0 H 0 C 0

SWAP [HL]

Swap the upper 4 bits in the byte pointed by **HL** and the lower 4 ones.

Cycles: 4 Bytes: 2

Flags: See SWAP r8

XOR A,r8

Bitwise XOR between the value in r8 and A.

Cycles: 1 Bytes: 1

Flags:

Z Set if result is 0.

N 0 **H** 0 **C** 0

XOR A,[HL]

Bitwise XOR between the byte pointed to by HL and A.

Cycles: 2 Bytes: 1

Flags: See XOR A,r8

XOR A,n8

Bitwise XOR between the value in n8 and A.

Cycles: 2 Bytes: 2

Flags: See XOR A,r8

SEE ALSO

rgbasm(1), rgbds(7)

HISTORY

rgbds was originally written by Carsten Sørensen as part of the ASMotor package, and was later packaged in RGBDS by Justin Lloyd. It is now maintained by a number of contributors at .: **https://github.com/gbdev/rgbds**
